## Making the most of R

Marcel Ramos

February 04, 2016

# Using R for Big Data

- Big Data
- Tidy Data
- Tips for learning R
- Reading data into memory
- Cleaning and Manipulating data with tidyr and dplyr
- Pipes for fluid and readable programming

# Big Data<sup>1</sup>

Size	Description
Big	Can't fit in memory on one computer: >5 TB
Medium	Fits in memory on a server: 10 GB - 5 TB
Small	Fits in memory on a laptop: <10 GB

#### *Note:*

R is great at small!

# Big Data (2)

- Reducible problems (subsetting, sampling, summarizing)
- Big data is often messy data and not much else
- Price to pay for big data

## Principles of Tidy Data

- Often said: 80% of data analysis is cleaning/munging
- Provide a standard way of organizing data<sup>2</sup>
- Each variable forms a column
- Each observation forms a row
- Each type of observational unit forms a table

Dataset	Variable	Variable
Observation	Value	Value
Observation	Value	Value

## Principles of Tidy Data (2)

- Why is tidy data important?
- Easier for the analyst and the computer to extract knowledge from a set of values
- Saves a lot of time

# Tips for learning R (general)

- Learning R may become frustrating at times
- Learning a language
- Practice is key

## Useful tips for learning R (stand-alone)

Pseudo code	Example code
install.packages(packagename)	install.packages(dplyr)
?functionname ?package::functionname ? 'Reserved keyword or symbol' (or backticks) ??searchforpossiblyexistingfunctionandortopic	?select ?dplyr::select ? '%>%' ??simulate
<pre>help(package = "loadedpackage") browseVignettes("packagename")</pre>	help("dplyr") browseVignettes("dplyr'

## Learning R via online courses

- Coursera
- edX
- RStudio
- Quick-R Mostly for basic and base functions
- RStudio Cheatcheets

## Reading and Loading Datasets into Memory

Requires installation of devtools package and Rtools (varies by OS)

```
devtools::install_github("username/repository")
devtools::install_github("hadley/readr")
devtools::install_github("hadley/haven")
```

#### Read Time

```
file.info("data/BRFSS2013_Data.csv")$size/(1024^2)
system.time(read.csv("data/BRFSS2013_Data.csv"))
library(readr)
system.time(read_csv("data/BRFSS2013_Data.csv"))
```

#### 58.8 MB File

Function	Elapsed Time
utils::read.csv	5.115
readr::read_csv	1.836

## Read Time (2)

- You may also consider the fread function
- data.table syntax is different

library(data.table)
?fread

## Data Munging using tidyr

- tidyr faciliates reshaping of data
- spread vs. gather \*most likely to use
- extract/separate vs. unite
- onest vs. unnest

## Data Manipulation using dplyr

- dplyr convention aims to ease cognitive burden
- Function names are easy to remember
- select (Y)
- mutate/transmute (add Ys / new Y)
- filter (get Xs based on condition)
- slice (get Xs specified)
- summarise (reduce to single observation)
- arrange (re-order observations)

## The tbl\_df class and show method

- Data frame print is messy
- tbl\_df provides same functionality (i.e. data.frame methods work)
- Output is neat and descriptive
- See: ?tbl\_df

Marcel Ramos

library(dplyr)
tbl df(mtcars)

```
## Source: local data frame [32 x 11]
##
##
       mpg
             cyl disp
                          hp
                              drat wt qsec
                                                  VS
                                                        am

               8 360 N
```

February 04, 2016

#### Examples of use

Create an example of messy data:

```
library(tidyr)
data("mtcars")
mtcars <- tbl df(mtcars)</pre>
mtcars <- select(mtcars, c(mpg:hp, wt, vs:carb))</pre>
mtcars <- unite(mtcars, cylgear, cyl, gear)</pre>
separate(mtcars, cylgear, c("cyl0", "gear0"))
## Source: local data frame [32 x 9]
##
##
        mpg cyl0 gear0 disp
                                hp wt
                                                       carb
                                            VS
                                                   am
      (dbl) (chr) (chr) (dbl) (dbl) (dbl) (dbl) (dbl)
##
    21.0
                      4 160.0 110 2.620
## 1
               6
    21.0 6
                      4 160.0 110 2.875
## 2
    22.8
                      4 108.0 93 2.320
                      2 OFO 0 110 2 OFF February
     Marcel Ramos
                                            February 04, 2016
```

#### Mutate & Transumte

```
head(mutate(mtcars, displ_l = disp/61.0237), 2)
## Source: local data frame [2 x 9]
##
##
     mpg cylgear disp hp wt vs am carb displ
    (dbl) (chr) (dbl) (dbl) (dbl) (dbl) (dbl) (dbl)
##
## 1 21 6 4 160 110 2.620 0 1 4 2.62193
## 2 21 6 4 160 110 2.875 0 1 4 2.62193
head(transmute(mtcars, disp_1 = disp/61.0237),2)
## Source: local data frame [2 x 1]
##
##
     disp l
##
     (dbl)
```

## 1 2.621932

## Example with base functions

```
data("mtcars")
mtcars <- mtcars[,c("mpg", "cyl", "disp", "hp",</pre>
                   "wt", "vs", "am", "gear", "carb")]
mtcars$cylgear <- with(mtcars, paste(cyl, gear, sep = "."))</pre>
mtcars[, c("cyl1", "gear1")] <- NA
mtcars[, c("cyl1", "gear1")] <-
 t(sapply(strsplit(mtcars$cylgear, ".", fixed = TRUE), FUN =
head(mtcars, 3)
##
                 mpg cyl disp hp wt vs am gear carb cylge
## Mazda RX4 21.0 6 160 110 2.620 0 1 4
## Mazda RX4 Wag 21.0 6 160 110 2.875 0 1 4 4
## Datsun 710 22.8 4 108 93 2.320 1 1 4
```

February 04, 2016

#### Considerations

#### Be careful of loss of information!

- Row names were lost when converting to table\_df
- Solution: add rownames as variable

```
data(mtcars)
carrows <- rownames(mtcars)
mtcars <- tbl_df(mtcars)
mtcars <- mutate(mtcars, models = carrows)</pre>
```

## Functional programming example

```
hourly_delay <- filter(
  summarise(
    group_by(
      filter(
        flights,
        !is.na(dep_delay)
      ),
      date, hour
    delay = mean(dep_delay),
    n = n()
  n > 10
```

## Pipes for fluid and readable programming

- Piping operator: %>%
- Consider the previous example with pipes:

```
hourly_delay <- flights %>%
  filter(!is.na(dep_delay)) %>%
  group_by(date, hour) %>%
  summarise(delay = mean(dep_delay), n = n()) %>%
  filter(n > 10)
```

## More piping

```
library(nycflights13)
flights %>% group by(carrier) %>%
  summarise(avg depdelay = mean(dep delay, na.rm = TRUE),
            count = n()) %>% left join(airlines) %>%
    arrange(avg depdelay) %>% head
## Source: local data frame [6 x 4]
##
##
     carrier avg_depdelay count
                                                   name
                                                 (fctr)
##
       (chr)
                    (dbl) (int)
## 1
          US 3.782418 20536
                                       US Airways Inc.
## 2
        HA
                 4.900585 342 Hawaiian Airlines Inc.
## 3
    AS
                 5.804775 714 Alaska Airlines Inc.
     АА
                 8.586016 32729 American Airlines Inc.
## 4
## 5
          DI.
                 9.264505 48110 Delta Air Lines Inc.
## 6

```

#### Using separate

```
data(iris)
longdata <- gather(tbl df(iris), key = measure, n,</pre>
 Sepal.Length:Petal.Width) %>% separate(measure, c("type",
    "dimension"))
longdata %>% group_by(Species, type, dimension) %>%
  summarise(avg dim = mean(n, na.rm = TRUE))
## Source: local data frame [12 x 4]
## Groups: Species, type [?]
##
##
         Species type dimension avg_dim
          (fctr) (chr) (chr)
##
                                   (dbl)
          setosa Petal Length 1.462
## 1
          setosa Petal Width 0.246
## 2
          setosa Sepal Length 5.006
## 3
                                                   3.428
## 4
          <u>setosa Sepal</u>
                           Width
     Marcel Ramos
                                            February 04, 2016
                                                         23 / 28
```

#### Piping with tidyr

```
library(readr)
(pew <- read csv("../data/pew.csv"))</pre>
## Source: local data frame [18 x 11]
##
                      religion <$10k $10-20k $20-30k $30-40k $4
##
                         (chr) (int)
##
                                       (int)
                                                (int)
                                                         (int)

## Summary

- Big data not always the best option
- Tidy data makes everything easier and saves time
- Learning R can be a bit frustrating but certainly not impossible
- R is great for small types of datasets that fit into memory but can also be used in HPC
- Writing R code should not be a cognitive burden on the user
- R programming should be readable and fun to use!
